1. Executive Summary

Between October 13 and November 9, 2026 (28 days), wordizy.com received 30,221 impressions and 77 clicks from Google organic search — a click-through rate (CTR) of 0.26% at an impression-weighted average position of 15.6. The site's fundamental SEO problem in this period was not visibility: 189 distinct queries already rank in positions 4-15 and together account for 12,008 impressions. The problem is that those rankings earn almost no clicks. At benchmark CTRs for the same positions, the current impression base would produce roughly 400 clicks per 28 days; the site captured fewer than one fifth of that.

The analysis identified four root causes. First, head-term SERPs (wordle solver, unscramble, wordfeud helper) are saturated with apps, instant answers and People-Also-Ask blocks, so positions 7-12 frequently render below the fold on mobile; impressions accrue while clicks do not. Second, many title tags did not mirror the query phrasing searchers actually use, weakening both relevance matching and click appeal. Third, roughly 100 legacy URL variants (words-starts-by-*, /unscramble/... paths, /N-letter-words) were serving HTTP 200 duplicates of canonical pages, splitting ranking signals between URL variants. Fourth — and most seriously — a routing defect served the homepage, with HTTP 200 and an index,follow directive, for ANY unknown URL, exposing the site to unlimited soft-404 homepage duplicates.

On November 11, 2026 all controllable defects were fixed and deployed to production: titles and meta descriptions were rewritten across nine core tools and roughly 130 programmatic word-list pages (now count-enriched and phrased to match real queries, e.g. "1,173 5-Letter Words Starting With T — Wordle"); 15 legacy URL patterns now 308-redirect to their canonical forms; every valid slug is statically pre-rendered and unknown URLs return a real 404; owner-only pages are noindexed; the sitemap last-modified date was bumped; and IndexNow was re-pinged (after replacing a non-compliant key). Normalizing CTR toward benchmark at current rankings implies an estimated 250-400 additional clicks per 28 days; capturing the striking-distance pool at position ~5 implies up to roughly 380 more. Both figures are directional estimates, and Section 7 defines how to measure the actual effect.

2. Background and Objectives

wordIzy (wordizy.com) is a word-game toolkit launched in mid-2026: a word unscrambler, anagram and Wordle solvers, Scrabble/Wordfeud helpers, a dictionary checker, random word generation, a 60-second Anagram Blitz game, and about 130 programmatic word-list pages (words by starting/ending letter and by length). The user interface supports nine languages, while page metadata is English. Four editorial guides support long-tail intent.

This report was commissioned to answer one question: how can the existing Google Search Console data be exploited to grow organic traffic as fast as possible? The objectives are to (a) quantify where demand and rankings already exist, (b) diagnose why current rankings do not convert into visits, (c) ship the highest-leverage fixes immediately, and (d) lay out a prioritized roadmap for the following quarter. The scope covers Google organic search only; paid channels, social, and backlink audits are out of scope for this report.

3. Data Sources, Scope and Methodology

The analysis is based on two Google Analytics 4 exports of the linked Search Console property for the 28-day window October 13 - November 9, 2026: a landing-page report (141 URLs with clicks, impressions, CTR, average position and GA4 engagement metrics) and a query report (2,357 named queries). All 2,357 queries were programmatically classified into 21 intent clusters (for example wordle-solver, anagram-solver including the large family of misspellings, wordfeud, starts-with, best-wordle-starting-words).

To judge whether CTRs are abnormal, each page and query was compared against a benchmark CTR-by-position curve blended from widely published SEO CTR studies (roughly 27% at position 1, 5.5% at position 5, 2.2% at position 10, 1% at position 15, and lower beyond). "Striking distance" is defined as average position 4-15 — the range where realistic on-page improvements can plausibly move a result onto the visible part of the first page. All potential-impact figures in this report are estimates derived from that curve, not measurements.

Three caveats apply. First, about 12,000 impressions (40% of the total) come from anonymized queries that Search Console does not disclose, so named-query cluster totals undercount real demand. Second, GA4 was only installed on October 30, and its engagement columns show almost no engaged organic users in the overlap window — engagement figures are therefore not yet reliable and were not used for conclusions. Third, an average position can hide a bimodal distribution (some impressions at position 2, many at position 20), which is one reason CTRs can look extreme.

4. Core Findings

4.1 Site-Level Picture

Table 1 lists the ten highest-impression landing pages. The homepage (the Word Unscrambler) and /wordle alone carry 52% of all impressions. Only 13 pages receive more than 100 impressions, while the long tail of 128 pages — mostly letter-specific word lists — receives between 1 and 100 impressions each.

Table 1: Top landing pages by impressions (Oct 13 - Nov 9, 2026)

Landing page	Clicks	Impr.	CTR	Avg pos
/wordle	20	9,207	0.22%	10.3
/ (home — Word Unscrambler)	17	6,604	0.26%	13.6
/anagram	3	1,960	0.15%	12.3
/dictionary	1	1,922	0.05%	18.0
/guides/best-wordle-starter-words	3	1,710	0.18%	25.3
/scramble	3	1,454	0.21%	20.1
/wordfeud	0	1,084	0.00%	8.3
/wordstarts	8	743	1.08%	34.8
/wordends	1	724	0.14%	26.2
/wordle-starts	0	361	0.00%	11.2

4.2 The CTR Gap: Rankings Exist, Clicks Do Not

Figure 1 compares each major page's actual CTR with the benchmark CTR for its own average position. Every head page earns a small fraction of its expected clicks: /wordle converts 0.22% where 2.06% would be normal at position 10.3 (11% of benchmark); /dictionary converts 0.05% versus 0.70% (7% of benchmark); and /wordfeud earned literally zero clicks from 1,084 impressions at position 8.3, where roughly 28 clicks would be expected. The two exceptions prove the rule: /wordstarts earns 1.08% at position 34.8 (eight times benchmark) because a handful of highly specific queries like "words that start with a to z" match its title almost word for word, and /blitz earns 10.7% on branded game queries. Exact-match, specific-intent titles win clicks even from weak positions.

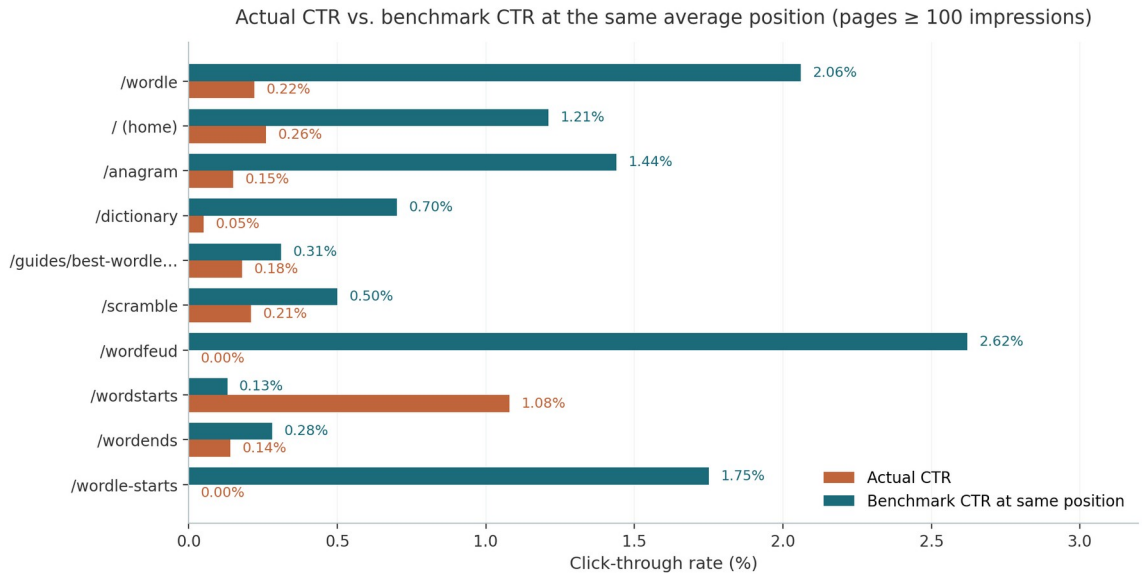

Figure 1: Actual CTR vs benchmark CTR at the same average position (pages with 100+ impressions).

4.3 Query Demand by Intent Cluster

Figure 2 and Table 2 aggregate named queries into intent clusters. The wordle-solver cluster (solver, helper, answer, pattern variants) is the site's center of gravity: 5,701 named impressions at an average position of 9.2 — yet only 9 clicks. The wordfeud cluster is the starkest anomaly: 886 impressions at position 8.2 with zero clicks, despite an exact-match "Wordfeud Helper" title. The anagram cluster, including more than sixty misspellings (anagam solver, annagram, anafram...), shows the same pattern at position 12.6. Two clusters reveal demand the site serves poorly today: the best-wordle-starting-words cluster (696 impressions, average position 44.7 — the guide ranks on page 5) and the generic starts-with/ends-with word-list clusters (positions 40-50, facing WordHippo-class competitors).

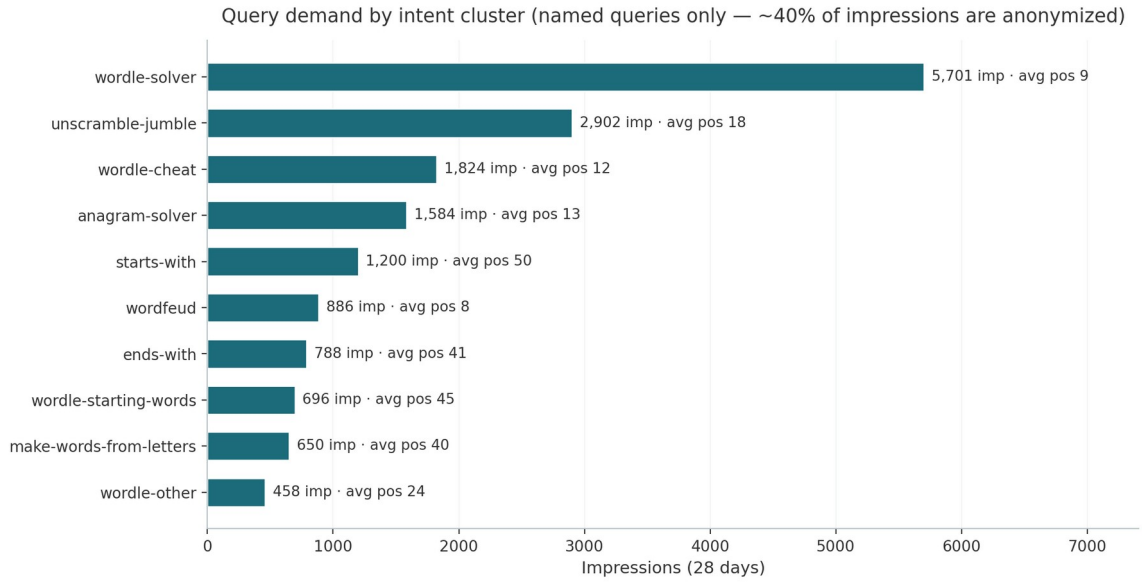

Figure 2: Impressions by intent cluster with impression-weighted average position (named queries only).

Table 2: Top intent clusters (named queries, 28 days)

Cluster	Queries	Impr.	Clicks	Avg pos
wordle-solver (solver / helper / answer)	155	5,701	9	9.2
unscramble / jumble / descramble	405	2,902	5	18.3
wordle-cheat	30	1,824	5	12.3
anagram-solver (incl. misspellings)	158	1,584	1	12.6
starts-with (general word lists)	305	1,200	7	50.0
wordfeud	17	886	0	8.2
ends-with (general word lists)	236	788	1	41.1
best wordle starting words (guide)	154	696	0	44.7
make words from these letters	278	650	0	39.9

Cluster	Queries	Impr.	Clicks	Avg pos
competitor-brand (capitalize my title...)	21	328	1	10.5

4.4 The Striking-Distance Pool

Table 3 lists the largest queries currently ranking in positions 4-15. Together this pool contains 189 queries and 12,008 impressions. Applying the benchmark curve at position 5 to each query yields an estimated ceiling of roughly 380 additional clicks per 28 days if the pool moved onto the visible part of page one. The pool is dominated by the head terms already discussed, but it also contains precisely-phrased helpers such as "wordfeud unscrambler" (148 impressions at 6.8) and "unscramble letters" (138 at 6.3) that convert to zero — these were primary targets of the title rewrite.

Table 3: Largest striking-distance queries (position 4-15)

Query	Impr.	Clicks	Avg pos
wordle solver	4,625	2	8.2
wordle cheat	1,306	5	11.2
unscramble	1,248	0	8.3
wordfeud helper	577	0	7.9
anagram solver	535	1	11.6
anagram	472	0	9.5
wordle helper	250	0	9.8
capitalize my title wordle	229	1	9.2
wordle cheater	152	0	12.0
wordle starts with	152	0	6.6
wordfeud unscrambler	148	0	6.8
unscramble letters	138	0	6.3
wordle help	102	0	9.5
worlde solver	100	2	12.3
wordfeud help	86	0	8.5

4.5 Page-Family Performance

Grouping the 141 pages into families exposes where the structural problems sit (Table 4). The 51 Wordle letter pages rank well (weighted position 12.5) but convert almost nothing — a family-wide CTR defect, consistent with the diagnosis in 4.2. The 59 general letter pages rank at position 40 on average because the family still contains legacy starts-by/ends-by URL variants that Google indexes separately from the canonical starts-with/ends-with URLs (for example /words-starts-by-n held 112 impressions at position 71.6 while /words-starts-with-n

fought for the same queries). The four guides, despite sitewide footer links, average position 24 — a content-depth problem rather than a linking problem.

Table 4: Page families (28 days)

Family	Impr.	Clicks	Wtd pos
Core tools + homepage (13 pages)	22,981	58	12.7
Wordle starts/ends letter pages (51 pages)	2,959	4	12.5
General starts/ends letter pages (59 pages)	2,339	12	40.3
Guides (4 pages)	1,892	3	24.2
Unscramble-by-length pages (10 pages)	25	0	22.0

5. Root-Cause Diagnosis

5.1 Positions 7-12 Sit Below the Fold in Feature-Heavy SERPs

Mobile devices account for roughly two thirds of these queries, and the SERPs for wordle solver, unscramble and wordfeud helper are saturated: Google's own widgets, app packs, People-Also-Ask accordions and dictionary instant answers routinely push organic results seven and lower below the first screen. Search Console still counts those below-fold renderings as impressions, which inflates impressions while suppressing clicks. The site's own data supports this: the pages that DO earn strong CTR (/blitz 10.7% at position 8.9, /about 2.5% at 7.0, /wordstarts 30% on exact-match long-tails) compete in less feature-heavy results. The practical implication is that positions 7-12 are worth far less than the benchmark curve assumes, and that both CTR optimization and genuine top-5 movement are needed.

5.2 Title Tags Did Not Mirror Query Phrasing

Searchers typed "words that start with t" while the page title read "Words Starting With T"; they typed "word scrambler tool" (64 impressions, position 7.0) against "Word Scramble Solver"; "wordfeud unscrambler" (148 impressions, position 6.8) against "Wordfeud Helper". The letter pages also gave no concrete reason to click — no count, no length hook — while competitors display counts and 5-letter hooks. Because these pages sat at positions 6-9 with 0% CTR, the downside of rewriting was effectively zero and the upside material.

5.3 Ranking Signals Split Across Legacy Duplicate URLs

Before this fix, /words-starts-by-j, /words-starting-with-j and /unscramble/words-starting-with-j all returned HTTP 200 alongside the canonical /words-starts-with-j, differing only by a canonical-tag hint that Google demonstrably did not consolidate: Search Console shows both variant families accumulating impressions and positions independently (the starts-by

pages at positions 50-96). Every inbound link, every crawl budget unit, and every ranking signal landing on a legacy variant was being split away from the canonical page.

5.4 Soft-404: Any Unknown URL Rendered the Homepage

Verification against production confirmed that a request for any nonexistent path — for example /nonexistent-page-xyz or /Wordle — returned HTTP 200 with the full homepage content and an index,follow robots directive. This is a textbook soft-404 duplicate-content defect: any externally-created junk URL (typos, case variants, trailing segments, attack links) could enter Google's index as another copy of the homepage, diluting its signals. GA4 even recorded a landing page of "/?gtm_latency=1" (tag-preview traffic) in the organic report, illustrating how freely non-canonical URLs flowed into measurement.

5.5 International Demand Sees English-Only Snippets

Named queries already include wordle oplosser (Dutch, 20 impressions at position 9.1), wørdle solver (Norwegian, 8 at 8.8), wordle hjælper (Danish, 4 at 9.0), wordle löser deutsch (German, 15 across variants at positions 28-69) and dictionnaire wordfeud (French, 21 at 15.6) — all with zero clicks. The site switches language client-side, so Google only ever indexes the English version and these searchers see English titles. Wordfeud's core markets are the Nordic countries and the Netherlands, which makes this a genuine traffic reservoir rather than noise.

5.6 Measurement Caveats

GA4 was installed on October 30, so engagement columns cover only 11 of the 28 days, and they show essentially no engaged organic users in that overlap. This is either genuine rapid-bounce behavior on tool pages (plausible for solver utilities) or a measurement artifact of the GA4-Search Console join; either way it should be re-evaluated in the next reporting cycle before drawing conclusions. The ~40% anonymized-query share also means every named-query figure in this report is a floor, not a ceiling.

6. Actions Implemented on November 11, 2026

All changes below were built, verified against a production build (168 statically generated pages, 39 routes returning 200, 13 redirect patterns returning 308, unknown URLs returning 404) and deployed to production on November 11, 2026.

6.1 Title and Description Rewrites (CTR Recovery)

Nine core tool pages and roughly 130 programmatic word-list pages received new titles and meta descriptions. Word-list titles are now count-enriched from the live dictionary store —

real counts computed at render time — because a number is the strongest click trigger available in a word-list SERP. Table 5 shows the key before/after pairs.

Table 5: Title rewrites shipped November 11, 2026

Page	Old title	New title
/wordle	Wordle Solver — Daily Cheat & Word Pattern Helper	Wordle Solver — Cheat, Helper & Answer Finder
/wordfeud	Wordfeud Helper — Find Best Words from Your Rack	Wordfeud Helper & Cheat — Best Words From Your Rack
/scramble	Word Scramble Solver — Descramble Jumbled Letters	Word Scrambler — Descramble & Unscramble Jumbled Words
/anagram	Anagram Solver — Find All Possible Hidden Anagrams	Anagram Solver — Find All Anagrams of Your Letters
/dictionary	Scrabble Dictionary Checker — Verify Words & Scores	Scrabble Dictionary Checker — Is It a Valid Word?
/wordstarts	Words Starts With A-Z — Browse Scrabble Words by Letter	Words That Start With A to Z — Word Lists by Letter
/wordends	Words Ends With A-Z — Browse Scrabble Words by Ending	Words That End With A to Z — Word Lists by Letter
/wordle-starts	Wordle Words Starting With A-Z — Best Starting Words	Wordle Words That Start With A to Z — Best Starters
/wordle-ends	Wordle Words Ending With A-Z — Hooks & Suffixes	Wordle Words That End With A to Z — Hooks & Suffixes
~130 word-list pages	Words Starting With "T" / Wordle Words Starting With "T"	Words That Start With "T" — 14,759 Valid Words / 1,173 5-Letter Words Starting With "T" — Wordle

6.2 Legacy URL Consolidation (301/308 Redirects)

Fifteen redirect patterns now permanently forward every legacy word-list variant to its canonical URL, folding all accumulated signals onto one address per page. Two broken aliases were fixed in passing: bare /unscramble previously served the homepage with no canonical (it now redirects to /), and /game served homepage content while carrying the game's VideoGame structured data (it now redirects to /blitz).

Table 6: Redirect patterns (all permanent)

Legacy pattern	Redirects to
/words-starts-by-{letter}	/words-starts-with-{letter}
/words-ends-by-{letter}	/words-ends-with-{letter}
/words-starting-with-{letter}	/words-starts-with-{letter}
/words-ending-with-{letter}	/words-ends-with-{letter}
/{n}-letter-words (e.g. /5-letter-words)	/unscramble-{n}-letter-words
/unscramble/{any legacy word-list slug}	matching canonical single-segment URL
/unscramble (bare)	/ (homepage)

Legacy pattern	Redirects to
/game	/blitz

6.3 Soft-404 Elimination and Full Static Pre-Rendering

The catch-all route now enumerates every valid slug (141 pages: homepage, 20 registry tools and info pages, 2 hidden owner views, 104 letter pages, 14 length pages) and disables on-demand rendering, so any unknown URL receives a real 404 status and the styled not-found page. As a side benefit, all 141 pages are statically pre-rendered and CDN-cached, improving Core Web Vitals. The owner-only /inbox and /dashboard pages are now marked noindex,nofollow.

6.4 Re-Crawl Acceleration

The sitemap last-modified timestamp was bumped to the deploy date, and IndexNow was re-pinged for all 142 sitemap URLs. During the re-ping, the original IndexNow key — a UUID containing dashes — was found to violate the IndexNow specification (keys must be 8-128 hexadecimal characters only) and was being rejected with HTTP 403 by both api.indexnow.org and bing.com/indexnow. A compliant 32-character hex key was generated, deployed, and the ping now succeeds.

7. Conclusions and Growth Roadmap

7.1 What Was Fixed Today (P0 — Deployed)

The November 11 deploy addressed every defect that was directly controllable in code: snippet appeal (titles and descriptions across ~140 pages), signal consolidation (redirects), index hygiene (real 404s, noindex on owner pages), delivery (full static pre-render) and crawl acceleration (sitemap bump, IndexNow). No further engineering action is required for these items; the next step for them is measurement.

7.2 P1 — Next Two to Four Weeks (Content Depth)

Three content plays attack the largest under-exploited demand pockets. First, rebuild /guides/best-wordle-starter-words into a genuinely comprehensive resource (data tables of top starters by letter frequency and vowel coverage, a second-guess framework, FAQ schema): its cluster carries 696 named impressions currently ranking at position 44.7, and the queries are informational enough that content depth moves them. Second, launch an "Is [word] a valid Scrabble word?" programmatic page set — the query data shows more than a hundred such lookups (is zave a scrabble word, izy scrabble word, is ez a scrabble word...) reaching /dictionary at positions 8-11 with almost no clicks; dedicated per-word pages would

both rank and convert. Third, add length-targeted sections to the Wordle solver page for "5/6/7/8 letter wordle solver" queries (43 combined named impressions, positions 7.8-25).

7.3 P2 — Structural Bets (Next Quarter)

Internationalization is the largest untapped reservoir: localized subpaths (for example /de/, /fr/, /nl/, /da/, /no/) with proper hreflang alternates would let the already-ranking Dutch, German, Danish, Norwegian and French queries finally see native-language snippets — particularly valuable for Wordfeud, whose demand is concentrated in exactly those markets. Second, authority building: Bing Webmaster Tools has flagged weak backlinks, and the site ranks 9-10 for competitor-brand queries ("capitalize my title wordle", 328 impressions) without earning clicks — a signature of low brand trust that only external signals will change. Third, expand the crossword-tips programmatic pattern, which already ranks positions 1-10 for roughly twenty persona long-tails (103 impressions at average position ~6) but at negligible volume per query.

7.4 Expected Impact and Measurement Plan

Two estimates frame the upside, both derived from the benchmark curve and therefore directional rather than promised. CTR normalization alone — bringing each head page to the benchmark CTR for its current position — implies roughly 250-400 additional clicks per 28 days from the existing impression base. Moving the striking-distance pool (12,008 impressions) onto the visible first page implies up to roughly 380 additional clicks. Realistically the fixes interact (better titles also improve rankings, redirects recover cannibalized positions), so the combined ceiling is on the order of 600-800 clicks per 28 days at full execution.

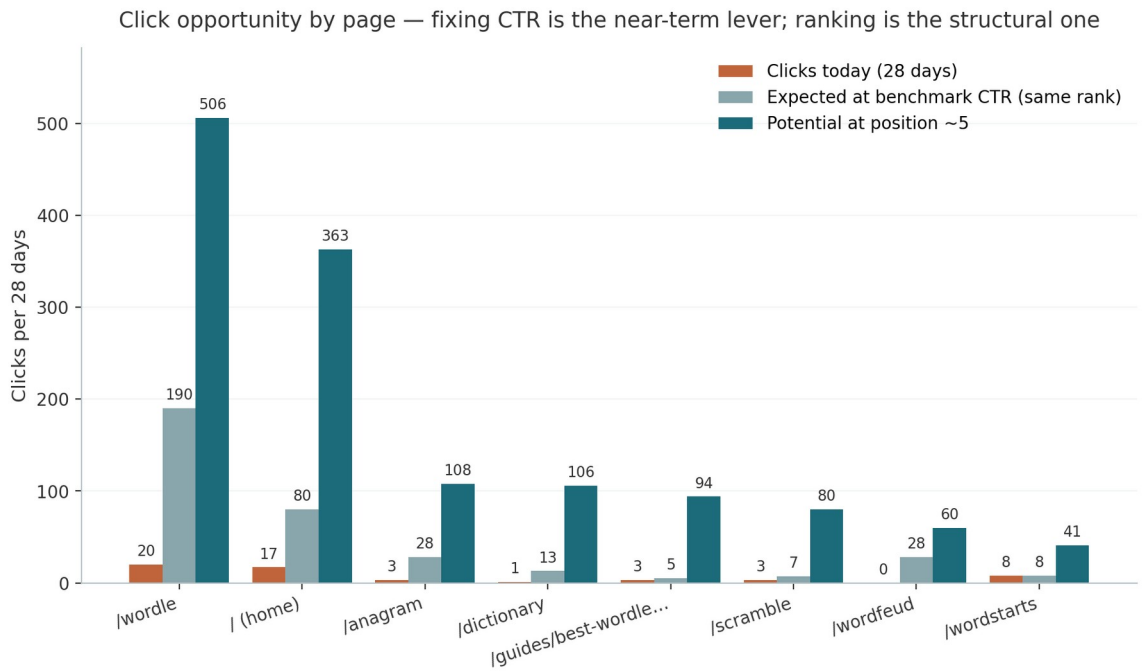

Figure 3: Click opportunity by page — current clicks vs expected clicks at benchmark CTR (same rank) vs potential at position ~5.

Measurement should compare the 28-day window starting roughly November 18 (allowing a week for re-crawling) against the October 13 - November 9 baseline. The key indicators, in order: average CTR for the nine rewritten tool pages (target: double or more); impressions and positions of the canonical letter pages as legacy variants drop out of the index; index coverage (the count of indexed pages should converge toward 141 plus guides, with soft-404s disappearing); and clicks on the ten money queries of Table 3. GA4 engaged sessions from organic should be re-baselined from November 11, since the property now has a clean start with the new deployment.

8. Appendix: Data Tables

8.1 All Clusters

Table 7: All 21 intent clusters (named queries, 28 days)

Cluster	Queries	Impr.	Clicks	Avg pos
wordle-solver	155	5,701	9	9.2
unscramble-jumble	405	2,902	5	18.3
wordle-cheat	30	1,824	5	12.3
anagram-solver	158	1,584	1	12.6
starts-with	305	1,200	7	50.0
wordfeud	17	886	0	8.2

Cluster	Queries	Impr.	Clicks	Avg pos
ends-with	236	788	1	41.1
wordle-starting-words	154	696	0	44.7
make-words-from-letters	278	650	0	39.9
wordle-other	112	458	1	23.6
other (uncategorized)	218	428	0	26.4
scrabble-checker	125	373	1	38.9
competitor-brand	21	328	1	10.5
crossword	37	149	0	12.3
letter-words-other	58	95	0	40.9
quordle	6	53	1	11.1
random-generator	18	49	0	16.7
is-it-a-word	8	34	0	25.5
dictionary	14	21	0	63.6
brand (wordizy / worldzy)	1	6	1	6.5
wordle-pattern	1	1	0	6.0

8.2 Notable Zero-Click Anomalies (Impressions ≥ 40)

Table 8: Zero-click anomalies and their diagnosis

Query	Impr.	Avg pos	Diagnosis
unscramble	1,248	8.3	≈ 33 expected clicks
wordfeud helper	577	7.9	≈ 16 expected clicks
anagram	472	9.5	≈ 11 expected clicks
yourdictionary unscramble	108	3.6	competitor-brand query
wordle starts with	152	6.6	≈ 5 expected clicks
wordfeud unscrambler	148	6.8	≈ 5 expected clicks
unscramble letters	138	6.3	≈ 5 expected clicks
scrabble word checker	79	46.1	ranking problem, not CTR
word scrambler tool	64	7.0	≈ 2 expected clicks
unscrambler	46	7.7	≈ 1 expected click
